## OPERATING GUIDELINES

**Membrane Characteristics:**

- The membrane used in these elements consists of a semipermeable polyethersulfone (PES) layer on a polyester backing material.
- Pure water flux of these PES HFK membranes is 1.0-2.2 gfd/psi (24-53 l/m<sup>2</sup>/h/bar) at 77°F (25°C).

**Options:**

- Diameter: 3.8", 4.3", 6.4", or 8.3"
- Length: 33", 35.5", or 38"
- Feed Spacer: N (31 mil), V (46 mil), H (62 mil), or F (80 mil)
- Outer wrap: Controlled (e.g. NYV) or trimmable (e.g. NYT)

**Operating Limits:**

- **Operating Pressure:** Maximum operating pressure is 140 psi (9.7 bar).
- **Permeate Pressure:** Permeate pressure should not exceed baseline (concentrate) pressure at any time (including online, off-line and during transition). Reverse pressure will damage the membrane.
- **Differential Pressure:** The maximum differential pressure per element is listed on the front of this document, including design values for multi-element housings.
- **Temperature:** Maximum operating temperature is 131°F (55°C), maximum cleaning temperature is 122°F (50°C).
- **pH:** Allowable range for continuous operation is 2.0 to 10.0. Allowable pH range for cleaning is 1.8 to 11.0.

**Water Quality for Cleaning & Diafiltration:**

- **Turbidity and SDI:** Maximum feed turbidity is 1 NTU. Maximum feed SDI is 5.0 (15-minute test).
- **Guidelines:** Please refer to the KSS "Water Quality Guidelines for CIP and Diafiltration" for more detailed information.

**Chlorine and Chemical Exposure:**

- Adherence to cleaning and sanitizing procedures including chemical concentrations, pH, temperature, and exposure time is necessary to achieve maximum useful element life. Accurate records should be maintained.
- KSS standard cleaning procedures for food and dairy applications should be followed. Recommended chlorine exposure time at the defined conditions is 30 minutes per day.

- Residual chlorine concentration during cleaning cycle (CIP) should be 150 ppm @ pH 10.5 or higher. Chlorine concentration should never exceed 200 ppm.
- Chlorine should only be added to the cleaning solution after the pH has been adjusted to 10.5 or higher.
- Iron or other catalyzing metals in the presence of free chlorine or hydrogen peroxide will accelerate membrane degradation.
- Sanitizing should be done only after a complete cleaning cycle and with water of acceptable quality. Refer to cleaning instructions and feedwater quality technical bulletins.

**Cationic (Positively Charged) Polymers and Surfactants:**

HFK membranes may be irreversibly fouled if exposed to cationic (positively charged) polymers or surfactants. Exposure to these chemicals during operation or cleaning is not recommended and will void the warranty.

**Lubricants:**

For element installation, use only water or glycerin to lubricate seals. The use of petroleum or vegetable-based oils or solvents may damage the element and will void the warranty.

**Supplemental Technical Bulletins:**

- UF Element Cleaning Procedures
- Water Quality Guidelines for CIP and Diafiltration
